

AI-Powered Program Management Playbook

A force-multiplier stack for cross-functional programs — from inception to launch.

Slack · GitHub · Datadog · Heap · Amplitude · Notion / Confluence

4 MCP servers connected · Slack · GitHub · Datadog · Heap · Amplitude · Notion · Tool costs detailed per card

FIVE CORE PILLARS

Stakeholder alignment

Change management, adoption & influence

Program planning

Roadmaps, dependencies, risk registers

Systems thinking

Architecture impact & technical tradeoffs

Risk & delivery

Error signals, deps, escalation paths

TPM craft & enablement

Best practices, AI delivery, org learning

TOOL STACK OVERVIEW · FULL DETAIL ON PAGES 2–3

CORE AI

Claude

Strategic thought partner — exec briefs, risk registers, stakeholder narratives

~\$20–40/mo · API

COMMUNICATION & CALENDAR

Gmail + Google Calendar MCP

Auto-draft updates, agendas, follow-ups. Schedule syncs and block focus time

Included · MCP

Slack MCP

Monitor channels for blockers, decisions, escalations. Summarize overnight threads

~\$0–10/mo · MCP

ENGINEERING DELIVERY

GitHub MCP

PR velocity, release branch health, CI failures. Auto-generate delivery summaries

~\$0–5/mo · MCP

Jira / Linear

Sprint health, at-risk epics, ticket creation from meeting notes, dependency maps

~\$0–15/mo · API

Meeting intelligence

Auto-transcribe syncs, extract action items and owners, push to Notion or Jira

~\$10/mo · SaaS

n8n — Agentic workflow automation

Orchestrates all tools into automated pipelines: Slack alerts trigger Jira tickets, GitHub events update Notion, Datadog incidents auto-create status briefs

~\$20/mo · Self-host

PRODUCT OBSERVABILITY

Datadog

Error rate spikes, latency regressions, SLO breaches correlated with releases

~\$0–5/mo · API

Heap

Feature adoption funnels, drop-off points, session behavior tracked post-launch

Plan-based · API

Amplitude

Engagement, retention, conversion vs OKRs — GTM impact summaries for exec review

~\$0–10/mo · API

DOCUMENTATION — CHOOSE ONE

Google Drive MCP

Generate charters, RACI matrices, retro docs, roadmap templates

Included · MCP

Notion MCP

Auto-generate release notes, maintain living program docs, create post-mortems

~\$0–5/mo · MCP

Confluence

Release notes linked to Jira releases, ADRs, stakeholder-facing program pages

Included · Native

SIGNAL SOURCES MONITORED BY AI

Slack

Blockers
Decisions
Escalations
Sentiment

GitHub

PR velocity
CI failures
Release health
Stale branches

Jira/Linear

Sprint burndown
At-risk epics
Dep slippage

Datadog

Error spikes
Latency p99
SLO breaches
Alerts

Heap

Adoption funnels
Drop-off
Sessions

Amplitude

Engagement
Retention vs OKRs

Gmail

New asks
Approvals
Compliance
Exec threads

Notion/Conf.

Stale docs
Release gaps
Missing ADRs

n8n

Slack→Jira
Datadog→Notion
GitHub→Release
Meetings→Tasks

Tool Deep-Dives

What each tool does, why it matters, and how the AI uses it

Page 2 of 4

CORE AI ASSISTANT

Core AI assistant

~\$20–40/mo · API

Claude — Strategic thought partner

WHY IT MATTERS

The central reasoning engine — handles synthesis, judgment, and communication. Drafts exec briefs, coaches on agile formats, generates risk registers and frameworks.

HOW THE AI USES IT

Drafts status reports from raw inputs, rewrites stakeholder comms for audience, generates escalation briefs, answers framework questions on-demand.

Cost: ~\$20–40/mo · Integration: API

COMMUNICATION & CALENDAR

Communication & calendar

Included · MCP

Gmail + Google Calendar MCP

WHY IT MATTERS

Email and calendar are where alignment happens — and where TPM time gets lost. AI closes the loop between what's decided in meetings and what gets communicated.

HOW THE AI USES IT

Scans inbox for asks and compliance flags. Drafts follow-up emails, agendas, RACI reminders. Schedules syncs and blocks focus time automatically.

Cost: Included · Integration: MCP

Communication & calendar

~\$0–10/mo · MCP

Slack MCP — Channel signal monitoring

WHY IT MATTERS

Most real-time decisions and stakeholder friction surface in Slack first — before Jira or email. Without this, the AI is blind to the most active signal channel.

HOW THE AI USES IT

Monitors channels overnight, summarises threads with blockers or decisions, flags sentiment shifts, drafts replies to pings, feeds summaries into status reports.

Cost: ~\$0–10/mo · Integration: MCP

ENGINEERING DELIVERY

Engineering delivery

~\$0–5/mo · MCP

GitHub MCP — Delivery pulse

WHY IT MATTERS

Jira tickets don't show if code is actually shipping. GitHub is ground truth — PR velocity, CI status, and release branch health are leading indicators of slippage.

HOW THE AI USES IT

Tracks open PRs, stale branches, merge conflicts, failing CI. Correlates release branch state with sprint timelines. Auto-generates delivery summaries for status drafts.

Cost: ~\$0–5/mo · Integration: MCP

Engineering delivery

~\$0–15/mo · API

Jira / Linear — Sprint & dependency automation

WHY IT MATTERS

The source of record for sprint commitments. AI parses ticket state far faster than manual review — turning a 30-min sprint report into a 2-min review of a draft.

HOW THE AI USES IT

Summarises sprint burndown, flags at-risk epics, creates tickets from meeting action items, generates dependency maps and sprint velocity reports.

Cost: ~\$0–15/mo · Integration: API

Engineering delivery

~\$10/mo · SaaS

Meeting intelligence — Otter / Fireflies / Granola

WHY IT MATTERS

Programs run on meetings. Without auto-capture, action items get lost, owners go unassigned, and the TPM spends hours turning notes into artifacts manually.

HOW THE AI USES IT

Transcribes all syncs, extracts action items with owners and due dates, identifies decisions and blockers, pushes structured summaries into Notion, Drive, or Jira.

Cost: ~\$10/mo · Integration: SaaS

Engineering delivery

~\$20/mo · Self-hosted / Cloud

n8n — Agentic workflow automation

WHY IT MATTERS

The orchestration layer that ties the entire stack together. n8n connects every signal source and tool into automated pipelines — eliminating the manual handoffs between systems that drain TPM time.

HOW THE AI USES IT

Slack blocker detected → Jira ticket auto-created. Datadog alert → status brief drafted in Notion. GitHub release merged → release notes triggered. Meeting action items → Jira tasks. All without manual intervention.

Cost: ~\$20/mo · Integration: Self-hosted / Cloud

PRODUCT OBSERVABILITY

Product observability

~\$0–5/mo · API

Datadog — Error rates & service health

WHY IT MATTERS

A TPM managing AI product delivery needs production visibility, not just sprint velocity. Error spikes and SLO breaches are delivery risks that belong in program status.

HOW THE AI USES IT

Monitors error rates, latency p99, alert volumes across services. AI correlates incident timing with releases to surface program-level impact. Feeds health into status drafts.

Cost: ~\$0–5/mo · Integration: API

Product observability

Plan-based · API

Heap — Feature adoption & user behavior

WHY IT MATTERS

Launch success is measured by adoption, not shipping. Heap captures retroactive behavioral data — answering 'are users using what we built?' without extra instrumentation.

HOW THE AI USES IT

Pulls adoption funnel data, identifies drop-off points, flags features below success targets. AI generates adoption summaries for exec reviews and change management reports.

Cost: Plan-based · Integration: API

Product observability

~\$0–10/mo · API

Amplitude — Product usage & business impact

WHY IT MATTERS

Exec stakeholders need business outcomes, not ticket counts. Amplitude translates product usage into engagement, retention, and conversion metrics that map to program OKRs.

HOW THE AI USES IT

Queries engagement and retention cohorts, tracks conversion vs OKR targets, generates GTM readiness assessments. AI produces impact summaries for Friday updates and QBRs.

Cost: ~\$0–10/mo · Integration: API

DOCUMENTATION

Documentation

Included · MCP

Google Drive MCP — Program artifacts

WHY IT MATTERS

Program artifacts live in Drive and get stale fast. Connecting Drive to AI lets existing docs provide context for drafting updates — no starting from scratch each time.

HOW THE AI USES IT

Reads existing program docs as context, generates charters and RACI matrices, drafts roadmap updates, creates retrospective documents, archives meeting summaries.

Cost: Included · Integration: MCP

Documentation

~\$0–5/mo · MCP

Notion MCP — Release notes & program wiki

WHY IT MATTERS

Release notes and program wikis are high-effort, low-glamour TPM work. Notion's flexible structure is ideal for living documents updated AI-first each sprint.

HOW THE AI USES IT

Auto-generates release notes from Jira resolved tickets and GitHub merge history, maintains living program docs, creates post-mortems, keeps sprint wikis current.

Cost: ~\$0–5/mo · Integration: MCP

Documentation

Included · Native

Confluence — Technical docs & release notes

WHY IT MATTERS

Best choice if the org is already on Atlassian. The native Jira–Confluence integration means release notes auto-pull from resolved tickets with no glue code needed.

HOW THE AI USES IT

Publishes release notes linked to Jira releases, maintains architecture decision records, keeps stakeholder-facing program pages current, surfaces outdated content for refresh.

Cost: Included · Integration: Native

Automation Flow, ROI & Principles

Weekly cadence, time reclaimed, and responsible AI guidelines

Page 4 of 4

WEEKLY AUTOMATION FLOW

MONDAY Intake & triage AI scans Slack and Gmail overnight. Datadog alerts reviewed. Blockers flagged. Weekly agenda drafted.	TUE-WED Execution pulse Meeting notes captured. Action items pushed to Jira. GitHub and Datadog delivery risks correlated.	THURSDAY Status synthesis Draft from Jira + GitHub + Heap and Amplitude. Impact metrics included. Ready in under 5 minutes.	FRIDAY Comms & docs Stakeholder updates sent. Release notes to Notion or Confluence. Amplitude GTM summary drafted.	AS NEEDED Escalation briefs Error spikes or adoption drops trigger a data-backed brief drafted for senior leadership review.
--	--	---	---	--

HOW N8N ORCHESTRATES THE FULL STACK

n8n — the orchestration layer that ties the entire stack together

n8n is the orchestration layer that closes every loop in this stack. When Datadog fires an alert, n8n triggers a Slack notification and drafts a Notion status brief automatically. When a GitHub release merges, n8n kicks off release note generation in Confluence or Notion. When Heap flags an adoption drop, n8n routes the signal to the right Jira epic — eliminating manual handoffs between tools that consume TPM time daily.

ESTIMATED VALUE PER WEEK

3–5h Status reporting & comms drafting	2–3h Meeting notes & action items	1–2h Docs & release notes	1–2h Slack triage & summaries	1–2h Incident & usage triage	\$80–280 Est. monthly tool cost
--	---	-------------------------------------	---	--	---

MONTHLY COST BREAKDOWN

Included / \$0	Gmail, Calendar, Drive MCP (Google Workspace) · Confluence if on Atlassian
~\$10–20/mo	Meeting intelligence: Otter.ai, Fireflies, or Granola
~\$20–40/mo	Claude API usage at moderate volume (status reports, briefs, summaries)
~\$10–20/mo	Notion API · Jira API at typical TPM call volume
~\$5–15/mo	Slack MCP · GitHub MCP · Datadog · Heap · Amplitude read-only API access
~\$20/mo	n8n — self-hosted (free) or n8n Cloud; scales with workflow volume
~\$100–300 total	Full stack estimate — varies by Claude API volume and tool plan tiers

RESPONSIBLE AI PRINCIPLES

Human reviews all exec outputs AI drafts; TPM decides. No automated sends on high-stakes comms.	No sensitive data in public models PII, customer data, and confidential roadmap details stay out of prompts.	Cost gates on high-volume tasks Set monthly API budget caps. Prioritise the highest-ROI use cases first.	Audit AI outputs regularly Spot-check status reports and escalation briefs weekly for accuracy.	Enable, don't replace judgment AI surfaces signals; humans make decisions and own relationships.	Measure adoption & business impact Track AI tool ROI, adoption rate, and output quality as program metrics.
